**A B S T R A C T**

Medicinal plants have been a major source of therapeutic agents to cure human diseases, since ancient time. *Terminalia arjuna* is one kind of widely used medicinal plant used in various indigenous system of medicine like Ayurveda, Siddha and Unani. This review has been conducted to pile up phytochemical as well as pharmacological information that is available in different scientific literatures. This plant has been reported to contain phytochemical constituents like Triterpenoids (arjunolic acid, arjunic acid, arjunin, termic acid, etc.), Glycosides (arjunetin, arjunosides, arjunglycosides etc.), Flavonoids (Arjunone, arjunolone etc.), Tannins (casuarinin, gallic acid, pyrocatechols etc.), β-Sitosterol, Minerals (calcium, magnesium, zinc, copper etc.). Which exhibit various pharmacological activities like Antimicrobial, Anti cancer, Cardioprotective, Anti fungal, Anti diabetic, Antioxidant, Anti inflammatory, Hypolipidemic, Anthelmintic, Insecticidal, Wound healing, Anti acne, Gastroprotective etc. The present comprehensive review is therefore an effort to give detailed information on phytochemical and pharmacological studies of *T. arjuna*.

1. Introduction
The revival of interest in natural drugs started in last decade mainly because of the wide spread belief that green medicine is healthier than synthetic products. Nowadays, there is manifold increase in medicinal plant based industries due to the increase in the interest of use of medicinal plants throughout the world which are growing at a rate of 7-15% annually. Despite the major advances in the modern medicine, the development of new drugs from natural products is still considered important. This seems to be even more relevant for the developing countries, where the cost to develop a drug is prohibitive. Since 1980, the World Health Organization has been encouraging countries to identify and exploit traditional medicine and phytotherapy. The main Indian Traditional System of Medicine namely Ayurveda and Siddha are primarily plant based system. The evaluation of new drugs especially phytochemically obtained materials has again opened a vast area for research and development. As per WHO, about 80% of the population in the world relays on the traditional medicine for the treatment of various diseases. Therefore, the evaluation of rich heritage of traditional medicine is essential. In this regard, one such plant is Terminalia arjuna (Wt. and Arn. which is a deciduous and evergreen tree, standing 20–30m above ground level. It belongs to Combretaceae family. It is found in abundance throughout India growing to a height of 20-30m above ground level. In the Indian system of medicine, T. arjuna bark is used for many complications. The aim of present review is to highlight the phytochemical and pharmacological investigation carried out on the plant so that more pharmacological studies could be conducted to investigate the unexploited potential.

3. Pharmacological Activities

1. Antimicrobial activity:
When total 34 plant species belonging to 18 different families were assayed for antibacterial activity against Escherichia coli, Klebsiella aerogenes, Proteus vulgaris, and Pseudomonas aerogenes (gram-negative bacteria) by the disc diffusion method, about 16 plants showed activity. Among them *Terminalia arjuna* showed significant antibacterial activity against the tested bacteria [17]. Antimicrobial activity of different solvent extracts from *T. arjuna* reported previously are summarized in below Table.

3. **Cardioprotective activity:**

There are different types of therapeutic use of *T. arjuna* for cardiac disease that based on empirical explanation recorded in various treatment of ancient medicine.

(a) **Cardiotonic activities:**

Arjunolic acid is used as a cardiac tonic in ayurvedic medicine for centuries and it has been first isolated from *T. arjuna*. The bark extracts have major component triterpenoid saponin is an arjunolic acid. [35] Besides Arjunolic acid, Arjungenin was also found to be most active as direct free radical scavenger and inhibitor for the hypochlorous acid production followed by its glucoside that was almost 50% active resulting in cardioprotective action. [36] The aqueous extract of the bark is isolated from rat atria that confirmed positive inotropic activity. [37, 38] *Terminalia arjuna* (Aqueous Extract) increased the force of contraction of cardiac muscle in frog’s heart in situ, hypodynamic frog’s heart in situ and isolated perfused rabbit heart. [39]

(b) **Anti anginal effects & Myocardial infarction:**

Treatment with *T. arjuna* is fairly effective in patients with symptoms of stable angina pectoris. However, it has a limited role in unstable angina. [40] *Terminalia arjuna* ethanol extract (TAEE) and *Terminalia arjuna* aqueous extract (TAAE) both produced significant cardioprotection in isoproterenol induced myocardial infarction in animals. [41,42,43]

(c) **Coronary flow:**

*Terminalia arjuna* (Aqueous Extract) increased the coronary flow at a 400 g dose in isolated perfused rabbit heart along with dose dependent bradycardia. However the doses required were high as compared to digoxin so the agent proved to be less potent as compared to digoxin. [39] The coronary flow was significantly enhanced with 1024 g/ml dose of TA extract on the isolated perfused rabbit heart. [44]

(d) **Hypotensive effects:**

Intravenous injection of alcoholic and aqueous extract of bark causes dose-dependent persistent bradycardia and hypotension. [45] 70% alcoholic extract of *Terminalia arjuna* produced hypotension of peripheral origin which may be due to adrenergic β2-receptor agonistic and/or direct action on the heart.[46]

4. **Antifungal activity:**

The organic extracts of five *Terminalia* species (*T. arjuna, T. chebula, T. bellerica, T. catappa*...
and T. alata) were tested with plant pathogenic fungi i.e. A. flavus, A. alternata, A. niger, A. brassicicola, and H. tetramera. The leaves extracts of all five plants found to inhibit these plant pathogens. [47] The polar extracts of T. arjuna demonstrated strong anti fungal activity against eight species of Candida. [22] The antifungal activities of Terminalia arjuna leaves extract (40, 60, 80,100 %) were tested against three fungal strains. Aspergillus niger, Tricoderma viride and Fusarium oxysporum which showed remarkable inhibition of fungi growth.23 The bark extracts were more effective than fungicide (control) used in this antifungal test. Moderate antifungal activity against C. albicans, C. krusei and C. parapsilosis was exhibited by a mixture of arjunolic acid with minimum inhibitory concentration (MIC) values in the range of 50-200 μg/ml. [35]

5. Antidiabetic activity:
The T. arjuna extracts have potential effects on diabetes. T. arjuna bark extracts cause a significant reduction in liver and kidney markers such as alkaline phosphatase (ALP), acid phosphatase (ACP), alanine amino transferase (ALT), aspartate amino transferase (AST) and lactate dehydrogenase (LDH) as well as significant decrease in the activities of glucose-6-phosphatase, fructose-1,6-disphosphatase, aldolase and an increase in the activity of phosphoglucoisomerase and hexokinase in tissues and also cause a significant (P<0.05) increase in superoxide dismutase, catalase, glutathione peroxidase, glutathione-s-transferase glutathione reductase and glucose-6-phosphate dehydrogenase, reduced glutathione, vitamin A, vitamin C, vitamin E, total sulphhydril groups (TSH) and non protein sulphhydril groups (NPSH) in liver and kidney of alloxan induced diabetic rats, which clearly shows, the anti diabetic and antioxidant property of T. arjuna bark. [48, 49, 50]. Aqueous Bark Extracts of Terminalia Arjuna Stimulates Insulin Release, Enhances Insulin Action and Inhibits Starch Digestion and Protein Glycation in Vitro[51]. The organic extracts (Ethanolic, methanolic and acetone) of T.arjuna leaves and bark possess significant hypoglycaemic and anti-diabetic activity due to the presence of the phytochemicals (flavonoids, tannins, glycosides, alkaloids, terpenoids) in it which are strong antioxidants.[52, 53, 54]

6. Antioxidant activity:
The extracts of Terminalia arjuna may be explored as a potential source of antioxidants for their use in food and pharmaceutical industries.[55] The extracts from barks of investigated trees: A. indica, T. arjuna, A. nilotica, and E. jambolana Lam., exhibited outstanding antioxidant activity as measured by various antioxidant assays.66 Because of antioxidant activity of Terminalia arjuna, it could be very well used as hepatoprotective.57 Terminalia arjuna shows potential antioxidant and free radical scavenging activity due to presence of more amount of flavonoid and phenolic content. [58]

7. Anti-inflammatory:
The methanol extract of the leaves of Terminalia arjuna demonstrated significant analgesic and acute antiinflammatory activities in the tested models. [59] T.arjuna has anti-inflammatory potential against some phlogistic agents, immunomodulatory effect and also has anti nociceptive action probably mediated via opioid receptors. [60]

8. Lipid lowering activity
The rats receiving Terminalia arjuna had a marked reduction in total cholesterol, triglycerides, LDL cholesterol, and VLDL cholesterol as well as an increased HDL cholesterol when compared to the induced animals. Thus, Terminalia arjuna was observed to be the most potent hypolipidemic & hypotriglycemic agent. [61] T. arjuna significantly decreases Total Cholesterol, LDL and Triglyceride levels and increases HDL and lessens atherosclerotic lesion in aorta. Hence T. arjuna extract can effectively prevent the progress of atherosclerosis. This is likely due to the effect of T. arjuna on serum lipoproteins and its antioxidant and anti-inflammatory properties. [62] Arjuna bark acts as a hypolipidemic, hypocholesterolemic and oxidative stress lowering agent induced by high fat high cholesterol diet in rats. [63]

9. Anthelmintic activity:
Crude methanolic extracts of T. arjuna bark exhibited anthelmintic activity both in vitro and in vivo studies which may be mainly attributed to its tannin content. [64, 65] All extracts showed effective anthelmintic activity at 20 mg ml-1 concentration. [66]

10. Insecticidal property:
Arjunolic acid isolated from the stem of T. arjuna exhibits significant inhibitory activity towards fourth instar larvae of Spilarctia obliqua. [35]

11. Wound healing activity:
The hydroalcoholic extract of T. arjuna bark phytoconstituents was reported to be used in topical application on healing rat dermal wounds. [35] T. arjuna has capability to complete epithelisation of excision wounds and increased tensile strength of incision wounds. [67]

12. Against ear infection:
T. arjuna plants extracts having a great potential to be developed as herbal ear drop to control the bacterial ear infections. All the organic T.arjuna extracts (acetone, ethanol or methanol) have
shown good activity against both the Gram positive and Gram negative ear pathogens, the inhibition being higher in Gram positive bacteria than the Gram negative bacteria. [18]

13. **Anti acne activity:**
Herbal anti-acne cream is non-toxic, safe, effective and improves patient compliance by the utilization of herbal extracts from T. arjuna would be highly acceptable. [68]

14. **Gastroprotective effect:**
Hydro alcoholic extract of TA was found to possess anti-ulcerogenic as well as ulcer healing properties, which might be due to anti-secretory activity. [69] *T. arjuna* acts as an gastroprotective agent probably due to its free radical scavenging activity and cytoprotective nature. [70]

15. **Anti asthmatic activity:**
Arjunolic acid and alcoholic extract of *T. arjuna* have significant mast cell stabilization activity and specifically, arjunolic acid exhibits comparatively better stabilization activity than alcoholic extract of TA. [71] The antiasthmatic and antianaphylactic activity may be due to the mast cell stabilizing potential and inhibition of antigen induced histamine and acetylcholine release. [71, 35]

16. **Decrease arsenic-induced toxicity:**
Arsenic, one of the environmental pollutants, causes tissue damage. Its exposure occurs from inhalation, absorption through the skin and by ingestion of contaminated food and drinking water. An impaired antioxidant defence mechanism followed by oxidative stress is the major cause of arsenic induced toxicity. Arjunolic acid has been shown to protect against arsenic induced cytotoxicity probably due to its free radical scavenging as well as metal chelating properties. [72]
